Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antigens - useful in disease treatment, and method for identification of other self and non-self antigens implicated in auto-immune disease.

Claim 2; Page 44; 58pp; English.

pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (MBP) polypeptide which is capable of tolerising an individual to an autoantigen, or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MIC class II protein, such as HIA. Which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with the autoimmune disease. This peptide is an internal peptide of

à 요

```
The present sequence represents an immunogenic peptide, derived from myoglobin, which is useful for generating antigen specific T cells. It may be used in the course of the invention. The specification describes the use of an agent which regulates cell proliferation for modulating the levels of production of a gene product of interest in a host organism. The method comprises transforming an expandable population of cells with a transgene encoding the gene product, expressing the gene in the host and regulating proliferation of the population of cells by administration of the agent. The method is useful for regulating cell proliferation. The method is also useful for regulating cell proliferation. The method is also useful for allowed the agent of cancer, inflammation, autoimmune disease, dermatological disorder, neurodegenerative disorder, atherosclerosis, rheumatoid arthritis, osteoporosis, chronic ulcers, psoriasis, rheumatoid diseases and infectious diseases
                                                                                                                                      Immunogenic peptide; antigen specific T cell; cell proliferation; cancer; inflammation; autoimmune disease; dermatological disorder; neurodegenerative disorder; atherosclerosis; rheumatoid arthritis; stepporatis; chronic ulcer; psoriasis; cardiovascular disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Regulating expression of transgenes encoding enzymes or hormones in mammals, by transforming expandable population of cells with desired transgene and regulating cell proliferation by administration of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pathogenic virus; alternative reading frame; antigenic determinant; virucide; vaccine; therapeutic agent; infection; HPV.
                                                                                                Immunogenic peptide useful for generating antigen specific T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 30; DB 3; 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a human fusion antibody for preventing and treating senile dementia. The antibody recognises and binds the beta-amyloid peptide and the fibres generated by it. The human antibody FC segment recognized by human immunocells are sequentially contained by its terminals from N to C. The fusion gene coding for the antibody is also disclosed. This sequence represents a beta-amyloid peptide recognised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Beta-amyloid peptide #4 recognised by antibody to treat senile dementia.
Pseudomonas aeruginosa phosphomannomutase protein and is implicated as foreign epitope involved in the aetiology or in remissions of multiple sclerosis. It has been shown capable of inducing the proliferation of autoreactive T-cell clones isolated from multiple sclerosis patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human fusion antibody for reducing cerebral amyloid fibers associated

This peptide corresponds to amino acids Lys6-Asp19 of PTEN (see AAM97802), a novel human dual specificity phosphatase that has tumour apppressor activity. It also includes a C-terminal Cys residue, not found in the wild-type PTEN, which was added to aid in the conjugation of the peptide to keyhole limpet haemocyanin. PTEN peptides (see AAM97805-08) were used to immunise rabbits. A rabbit injected with PTEN GillsBeval403 produced antibodies that recognised endogenous PTEN on immunoblots and in immunoprecipitations; this antibody was termed PTENs on immunoblots and in failed to produce antibodies that could recognise PTEN. PTEN polypeptides and polynucleotides (see AAX07339) can be used to develop products for the diagnosis and treatment of hyperproliferative disorders such as cancers, or neurodegenerative disorders such as Parkinson's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Amyloid formation; amyloid-like deposit; Alzheimer's disease; pathological beta-sheet-rich conformation; Down's syndrome; amyloidosis disorder; human prion disease; Kuru; CJD; Creutzfeldt-Jakob disease; Gerstmann-Straussler-Scheinker syndrome; GSS; prion associated human neurodegenerative disease; animal prion disease; scrapie; spongiform encephalopathy; transmissible mink encephalopathy;
                                                                                                              New use of PTEN phosphatase - for developing products for the diagnosis and treatment of hyperproliferative disorders, e.g. cancers or neurodegenerative disorders such as Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel inhibitory peptides which inhibit and structurally block abnormal folding of protein into amyloid or amyloid-like deposit and into

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 reading frame of a pathogenic virus, where the polypeptide starts with a methodine amino acid residue, which comprises an antigenic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a human papillomavirus (HPV) epitope peptide of the
                                                                                                                                                                                                                                                                                                                                                          New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel polypeptide encoded by an alternative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PTEN; MMAC1; protein tyrosine phosphatase; human; prostate cancer; brain cancer; prostate cancer; tumour suppressor; Cowden's disease; neurodegenerative disease; Parkinson's disease; diagnosis; therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein charp? Abera fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that bluds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of
The invention relates to inhibitory peptide comprising a portion of at least three amino acid residues and a sequence predicted not to adopt a beta-sheet structure that associates with a hydrophobic beta-sheet cluster on a protein or peptide involved in the abnormal folding into a beta-sheet structure, to structurally block the abnormal folding into a protein or peptide. The inhibitory peptide is useful for preparing a protein or perventing, treating or detecting disorders or diseases associated with amyloid-like fibril deposits e.g. Alzheimer's disease prion related encephalopathies. The invention is also useful in gene therapy. The present sequence is a peptide used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific antibody.
                                                                                                                                                                                                                                                                                                                                         Gaps

between proteins. The method comprises (1) digesting protein A into oligopeptides; (2) searching a protein sequence database for polypeptides (polypeptides (2) searching a protein sequence database for polypeptides (polypeptide C) containing these oligopeptide sequences or D their homologues; (3) performing a local alignment of A and detected C or D; and (4) using a value calculated from the amino acid or oligomucleotide frequencies, anticipating that C or D is polypeptide B that interacts with A. The method is useful for assaying anticipated information about proteins in biochemical, molecular biology, drug development, about allostrate the method

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide #16 for illustrating method of anticipating protein interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A set of peptide ligands consisting of specific complementary peptides proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.

contains recombinant nucleic acids comprising either: (a) a gene for a substrate protein (SP), which comprises a sequence region of 18 amino acids of the human amyloid precursor protein (APP) or a homologous protein, where the sequence region contains the alpha-secretase cleavage site at a reference of 6 residues at the N-terminal and 12 residues at the C-terminal, and (b) a gene for a protease protein (PP), that either comprises a proteolytically active necessary sequence region or a sequence region of the disintegrin metalloprotease ADAM 10 from a cow sequence region of the disintegrin metalloprotease ADAM 10 from a cow sequence region of the disintegrin metalloprotease ADAM 10 from a cow sequence region of the disintegrin metalloprotease ADAM 10 from a cow shows the same enzymatic properties, where the genes are under the control of heterologous promoters; or a heterologous RNA coding for a SP and a PP. The products of the invention have nootropic and a PP. The proteins of the invention are useful for protecolytic cleavage of substrate proteins, especially human amyloid precursor protein. Dominant metalloprotease ADAM 10 proteins and their coding sequences are useful for suppressing the alpha-secretase activity of a cell. Nucleic acid sequences encoding the proteins and recombinant cells are useful for constructing vectors for dentifying secretases and pharmaccutical agents and to identify risk factors associated with Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Alzheimer's Disease; AD; occular tissue; lens; amyloidogenic disorder; Creutzfeld-Jakob disease; spongiform encephalopathy; Prion disease; scrapte; bovine spongiform encephalopathy; veterinary prionopathy; Parkinson's disease; Huntingform's disease; trinucleotide repeat disease; amyotrophic lateral sclerosis; Down's Syndrome; Pick's Disease; prontotemporal Dementia; Lewy Body Disease; Hallervorden-Spatz Disease; syndcleinopathy; multiple system atrophy; neuronal intranuclear inclusion disease; tauopathy; progressive supranuclear palsy; corticobasal degeneration; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel recombinant cell comprising recombinant nucleic acids encoding a region of human amyloid precursor protein containing an alpha-secretase cleavage site and a protease or a heterologous RNA coding for a substrate protein and a protease. The
                                                                                                                                                                                              Antibodies recognising specific parts of beta-amyloid - can be used for diagnosis of diseases implicating beta-amyloid, such as Alzheimer's
                                                                                                                                                                                                                                                                                                                                   Antibodies which recognise specific subfragments of the beta-amyloid protein are claimed. Specifically, the antibodies (which are pref. monoclonal) recognise residues 1-16 and/or 1-28 from the N-terminal portion of beta-amyloid or they recognise residues 25-35 or 35-43 from the C-terminal portion. The antibodies are useful for assaying beta-amyloid and its derivatives for diagnosis of Alzheimer's disease. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant cells, for identifying alpha-secretase active agents and identifying risk factors associated with Alzheimer's disease, comprise

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                     The invention relates to a method for diagnosing or providing a prognosis regarding the state of Alzheimer's Disease (AD) in a mammal. The method involves contacting an ocular tissue with a detectably-labelled compound that binds to an amyloid protein where an increase in binding of the compound to the ocular tissue compared to the normal control level of binding indicates that the mammal is sufféring from or is at risk of developing AD. The method is also used for the diagnosis of amyloidogenic disorder e.g. Familial AD, Sporadic AD, Creutzfeld-Jakob disease, variant CC creutzfeld-Jakob disease, spongiform encephalopathy and other veterinary prionopathies). Parkinson's disease, Huntington's disease (and trincleotide repeat disease), amyotrophic lateral sclerosis, Down's Syndrome (Trisomy 21), Pick's Disease, Huntington's disease (and trincleotide repeat disease), synucleinopathies (including Parkinson's Syndrome (Trisomy 21), Pick's Disease, Huntington's disease, neurodegeneration with brain iron accumulation (Hallervorden-Spatz Disease), synucleinopathies (including Parkinson's cremeronal intranuclear palsy, Pick's disease, corticobasal corticobasal corticobasal and Guam amyotrophic lateral sclerosis/parkinsonism dementia complex). The present sequence is human amyloid-beta (Abeta) coppetide. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                             Method for diagnosing Alzheimer's disease in a mammal involves contacting an ocular tissue with a detectably-labeled compound that binds to an amyloid protein or use of magnetic resonance imaging.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosise factor (TWF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatio, immunosuppressive, immunostimulant, immunombulatory, antithemmatic and antiAIDs activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant ELyS expression of BLyS. They may also be considered to treat diseases associated with aberrant ElyS expression diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (CVID) and immunodeficiency (CVID) and immunodeficiency (CVID) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                      Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis; cerebral amyloid anglopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; osteomyelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.

The invention relates to a method for prevention and/or treatment of an anyloid-related disease which comprises administration of an all-D amyloid-related disease which comprises administration of an all-D amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta in a mammal and favours the carannee of soluble amyloid-beta in a mammal and favours or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid arthritis, juvonile chronic arthritis, ankylosing spondylitis, psoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposite are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus collers, chronic pyelonephritis, osteomyelitis and Whipple's disease).

Cortain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinoma, carcinomas of gut, lung and urogenital tract, basal cell carcinoma, carcinomas of gut, lung themethy sequence is an Abeta peptide used to illustrate the method of the
                                                                                                                                                                                                                                 Prevention and/or treatment of an amyloid-related disease e.g. Alzheimer's disease, comprises use of all-D-amyloid-beta peptides.
                                                                                                                                  Kong X;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUMMARIES

neuropeptide FFRFamide - blue mussel
N;Alternate names: FMRFamide-related decapeptide; Mytilus FFRFamide
C;Species: Mytilus edulis (blue mussel)
C;Species: Mytilus edulis (blue mussel)
C;Accession: A58365
R;Fujisawa, Y.; Ikeda, T.; Nomoto, K.; Yasuda-Kamatani, Y.; Minakata, H.; Kenny, P.T.M.;

antigens Pemphigus vulgaris auto-antigens and multiple sclerosis non-self anti-- useful in disease treatment, and method for identification of other self and non-self antigens implicated in auto-immune disease.

Claim 2; Page 44; 58pp; English.

pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (WBP) solypeptide Which is capable of tolerising an individual to an autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (Whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a WHC class II protein, such as HLA-DR, which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with

The composition of the invention is used for the prevention, treatment or alleviation of an autoimmune response and/or disease. The composition of the autoimmune response and/or disease in a mammal e.g. cellac disease, Crohn's disease, insulin dependent diabetes mellitus, Grave's disease, wantipple sclerosis, mysathenia gravis, psoriasis, rheumacoid arthritis, Sjogren's syndrome, systemic lupus erythematosus or ulcerative colitis. The present sequence is used in the exemplification of the invention.
the autoimmune disease. This peptide is an internal peptide of human papilloma virus type 7 L2 protein and is implicated as a foreign epitope involved in the aetiology or in remissions of multiple sclerosis. It has been shown capable of inducing the proliferation of autoreactive T-cell clones isolated from multiple sclerosis patients. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human; PCMT1; IAMT; L-Isoaspartyl (D-aspartyl)O-methyltransferase; IAMT; autoimmune; cellac disease; Crohn's disease; antoimmune; cellac disease; ansulin dependent diabetes mellitus; Grave's disease; multiple sclerosis; myaethena gravis; psoriasis; rheumatcold arthritis; Slogren's syndrome; systemic lupus erythematosus; ulcerative colitis; MBP87-99.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of L-Isoaspartyl (D-aspartyl)O-methyltransferase (IAMT) activity regulator, IAMT, IAMT encoding nucleic acid sequence or their functional derivatives for preparing composition for the treatment of an autoimmune response and/or disease.
                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the novel use of a regulator of L-Isoaspartyl (D-aspartyl)O-methyltransferase (IAMT) activity (A) or IAMT or IAMT encoding nucleic acid sequence or their functional derivatives in the preparation of a composition for the prevention, treatment or alleviation of an autoimmune response and/or disease. The composition of the autoimmune response and/or disease. The composition of an autoimmune response and/or disease in a mammal e.g. callac disease, Crohn's disease, insulin dependent diabetes mellitus, Grave's disease, whitiple sclerosis, mysathenia gravis, psoriasis, rheumatoid arthritis, sjogren's systemic lupus erythematosus or ulcerative colitis. The present sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a diagnostic assay (MI) comprising quantitative or qualitative determination of an auto-reactive immune system component specifically recognising an epitope (B) containing an isomerised peptide linkage and/or optically inverted amino acid, an auto-antigen or its fragment containing (B) and/or a non-self antigen or its fragment which contains (B) and is capable of inducing an autoimmune response. The diagnostic assay is useful for quantitative and qualitative determination of autoimmune reactivity of an isomerised protain sequence, which is an indicative of an autoimmune disease such as rheumatoid arthritis, multiple sclerosis, insulin dependent diabetes mellitus, myasthenia gravis, coeliac disease, Chaga's disease, psoriasis or Crohn's disease. The present sequence represents a specifically claimed example
                                                                                                                                                                                     Immunoglobulin G; IgG; myelin basic protein; MBP; MGG; Crohn's disease; myelin oligodendrocyte glycoprotein; alphaB-crystallin; MS; psoriasis; multiple sclerosis; rheumatoid arthritis; autoimmune disease; IDDM; immune system; insulin dependent diabetes mellitus; myasthenia gravis; coeliac disease; Chaga's disease; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnostic assay useful for quantitative/qualitative determination of autolimune reactivity comprises determining an immune system component recognizing epitope containing isomerized peptide linkage and/or optically inverted amino acid.
                                                                                                                                                                                                                                                                                                                      /note= "Asx can be alpha-D Asn or Asp, or is beta-D or
beta-L Asp"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 37; DB 4; Length 11;

The activity involves immunological reactivity with an apitope containing an isomerised peptide linkage and/ or an optionally inverted amino acid. The epitopes of the invention can be used for therapeutic or prophylactic treatment of the autoimmune diseases for the vaccination against autoimmune diseases for the vaccination against autoimmune diseases e.g. rheumatoid arthritis, multiple sclerosis, insulin dependent diabetes mellitus, mysthenia gravis. Celiac disease, Chagas' diseases, psoriasis and crown's disease. This sequence represents an isomerised/optically inverted epitope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of protein, peptide or their analogs containing an epitope recognized by an auto-reactive immune system for the treatment of autoimmune

A set of substituted peptides based on the sequence corresp. to the I-E restricted epitope MBP 89-99 in the rat was synthesised and tested for MHC binding. Six of the peptides (see AMR4899-R4904) have substantially reduced MHC binding affinity, a reduced ability to stimulate T-cells in vitro and a reduced ability to induce autoimmune disease. They are useful as competitor peptides to antagonise the T-cell receptor, e.g. to block the CDR3 region involved in multiple sclerosis. Oligopetide immunogens comprising one of the 6 amino acid sequences are also claimed. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modulating or tolerizing the immune system, useful for treating multiple sclerosis, by administering a peptide derived from human myelin binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WBP; myelin basic protein; tolerance; immune system; multiple sclerosis; autoimmune response; autoimmune disease; immunosuppressive;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptides AAB26878-B26881 represent four glycine rich peptide which may be N-acetylated and/or C-amidated and contain amino acids with Lor D configuration. Included in the invention is a pharmaceutical composition containing at least one of the peptides and an inert ingredient. The peptides have immunosuppressant and neuroprotective activity and induce anergy of autoreactive T lymphocytes without inducing an autoreactive response. The peptides are used to treat multiple sclerosis. The present sequence represents a fragment of the human myelin basic protein which is used in the invention in the design of the peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                              New glycine-rich peptides, useful for treatment of multiple sclerosis by induction of anergy in autoreactive T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                       ઠ
                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                             ö
                            This invention describes a novel method for modulating or tolerizing the immune system, and for treating multiple sclerosis comprising administering a peptide derived from hMBP (human myelin basic protein). The peptide induces an autoimmune response (T cell) to a self-antigen (or part of it), and binds to an MHC (major histocompatibility complex) antigen of a host susceptible to autoimmune diseases, i.e. competes with binding to MBP and inhibit proliferation of MBP-reactive cells. The peptide has immunosuppressive and neuroprotective activity. This sequence represents a synthetic analogue of the human MBP protein I-B restricted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of suppressing the immune function of CD4+ T cells, reactive with myelin basic protein (MBP) in patients with multiple sclerosis. The method comprises administering a peptide (1) that stimulates (in a proliferation assay) the subgroup of HLA (human leukocyte antigen)-DR2D-restricted T clones, from remitting-relapsing patients, that is reactive with another peptide. (1) contains immunodominant epitopes of MBP (residues 84-102) and when administered orally actively suppress T cells reactive with this epitope (by inducing CD8+ suppressor cells that express cytokines such as transforming growth factorbeta and interleukin-4), or when administered intravenously they
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Suppressing T cell response to myelin basic protein, useful for treating multiple sclerosis, by administering a peptide containing immunodominant epitope of the protein.
                                                                                                                                                                                                                                                                                             Gapa

The present invention describes a pharmaceutical formulation comprising a peptide having a 30-amino acid sequence (AAB12612) (I) or a segment of (I), provided that the segment comprises at least the 19-amino acid sequence given in AAB12613. The pharmaceutical formulation has neuroprotective and immunosuppressive activities. The compositions and peptides from the present invention are useful in suppressing multiple collections, which is due to the induction of CD8+ suppressing multiple peptides are also useful in identifying CD4+ T-cells reactive with myelin collection (MBP). The peptides are also useful in identifying characterism (MBP). The peptides are also useful in identifying characterism (MBP). The peptides are also useful in identifying characterism of MBP caperimental allergic encephalomyelitis (EAB). There was a decreased experimental allergic encephalomyelitis (EAB). There was a decreased inflammation in both the parenchyma and meninges when cells from MBP-fed animals were transferred. This suppression was observed when CD4+ capital etragment, which is used in an example from the present
                                                                                                                                                                                                                                           ô

Also described are: (a) a pharmaceutical composition containing at least one (I); (b) a vaccine containing at least one (I) where this is a major histocompatibility complex (MHC) ligand (Ia); (c) a method for in vitro diagnosis of diseases associated with the presence of (Ia); (d) a kit for method (c) that includes a (Ia); and (e) a process for preparing (I). (I) has immunomodulator, endocrine, antiallergic, neuroprotectant, virucidal, bactericidal, antiparasitic, fungicidal and cytostatic activities. (I) are useful, in human or veterinary medicine, in pharmaceutical compositions (for treating immune disorders, e.g.
                                                                                                                                                                                                                                                                                                                               Glutamic acid; glutamine; vaccine; major histocompatibility complex; MHC; immunomodulator; antiallergic; endocrine; neuroprotectent; virucidal; bactericidal; antiparasitic; fungicidal; cytostatic; medicine; pharmaceutical; immune disorder; immune deficiency; autoimmune; pharmaceutical; immune disorder; immune deficiency; autoimmune; central nervous system disease; cancer; melanoma; anti-melanoma vaccine; human immunodeficiency virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Stabilized pharmaceutical containing N-terminal glutamic acid or glutamine, useful e.g. in anti-melanoma vaccines, is an addition salt with strong acid.

The present invention describes a pharmaceutical compound (I) that contains an N-terminal glutamic acid (Glu) or glutamine (Gln) residue in an addition salt with a strong, physiologically acceptable acid (II). Also described are: (a) a pharmaceutical composition containing at least one (I); (b) a vaccine containing at least one (I) where this is a major histocompatibility complex (MrC) ligand (Ia); (c) a method for in vitro diagnosis of diseases associated with the presence of (Ia); (d) a kit for method (c) that includes a (Ia); and (e) a process of corporation (I). (I) has immunomodulator, endocrine, antiallargic, neuroprotectant, virucidal, bacterical, antiparasitic, fungicidal and cytostatic activities. (I) are usefuld, in human or veterinary medicine, or in pharmaceutical compositions (for treating immune disorders, e.g. immune deficiency, autoimmune states, hypersensitivity, allergy, graft rejection, infection, hormonal disorders and central nervous system crimesses), also, where (I) is a MrC ligand (Ia), in vaccines for treatment or prevention of: (i) viral, bacterial, parasitic or fungal infections; or (ii) of cancers. A particular application is in antimelanoma vaccines. (I) are also useful for in vitro diagnosis of diseases associated with interactions between MrC and (I), e.g. melanoma and human immunodeficiancy virus infection. AMM99898 to AAM99592 represent invention clamunodeficiancy virus infection. AMM99592 represent invention
                                                                                                                                                Glutamic acid; glutamine; vaccine; major histocompatibility complex; MHC; immunomodulator; antiallergic; endocrine; neuroprotectant; virucidal; bactericidal; antiparasitic; fungicidal; cytostatic; medicine; pharmaceutical; immune disorder; immune deficiency; autoimmune; hypersensitivity; allergy; graft rejection; infection; hormonal disorder; central nervous system disease; cancer; melanoma; anti-melanoma vaccine; human immunodeficiency virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Stabilized pharmaceutical containing N-terminal glutamic acid or glutamine, useful e.g. in anti-melanoma vaccines, is an addition salt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ï
                                                                                                           Vaccine related MHC ligand peptide SEQ ID NO:136.

immune deficiency, autoimmune states, hypersensitivity, allergy, graft rejection, infection, hormonal disorders and central nervous system diseases), also, where (1) is a MHC ligand (1a), in vaccines for treatment or prevention of: (i) iv intal, bacterial, parasitic or fungal infections; or (ii) of cancers. A particular application is in antimelanoma vaccines. (I) are also useful for in vitro diagnosis of diseases associated with interactions between MHC and (1), e.g. melanoma and human immunodeficiency virus infection. AAM98898 to AAM99592 represent peptides which can be used in pharmaceutical compounds from the present invention

```
AAR61714-837 are potential peptide binders of HLA-A2.1 motif. These peptides are thus potentially immunogenic. They were predicted by using an algorithm, which assigns a score for each amino acid, at each position along a peptide. A peptide is scored in the 'Grouped Ratio' algorithm as a product of the scores of each of its residues. This value can then be used to predict a population of peptides with the highest occurrence of good binders. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg. prostate cancer or lymphoma, etc. (Updated on 25-WAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a myelin basic protein (MBP) peptide formula. MBP peptides are capable of neutralising or modulating the production of anti-myelin basic protein. The present invention also describes a method for treating multiple sclerosis (MS). The method comprises administering to the patient an MBP peptide of the formula: R1-81-M8-Phe-Phe-Liys-Aan-Ila-R2 where R1, R2 = H, OH, or an amino acid residue and a polypeptide residue, provided that R1 and R2 are not both H or OH at the same time

The invention also relates to a pharmaceutical composition comprising a compound of the invention and a carrier. The compound or its salt is useful for treating or preventing a disease responsive to the inhibition of antigen binding to an MHC class II molecule, a disease responsive to the inhibition of antigen presentation by an MHC class II molecule or a disease responsive to the inhibition of T cell proliferation, which involves administering a compound or its salt to a patient in need of treatment, where the MHC class II molecule is human leukcoyte antigen-DR2. The compound or its salt is useful for treating or preventing treatment, where the MHC class II molecule is human leukcoyte antigen-DR2. The compound or its salt is useful for treating or preventing a cutofinamus disease, such as multiple sclerosis, Behcet's disease, Crohn's disease, glomerulonsphritis, idiopathic thrombocytopenic purpura, Inpus erythematosus, Meniere's disease, type I diabetes, profiten's syndrome, rheumatoid arthritis, scleroderma, Sjogren's syndrome, Heaphmone, rheumatoid arthritis, scleroderma, Sjogren's syndrome, wegener's granulomatosis, mysathenia gravis, ulcerative colitis, uveitis, stiff-man syndrome and vasculitis. This service the compound of the compound of the compound of the compound of the control of the class II antigen binding inhibitory compound
                                       Major histocompatibility complex; MHC class II molecule;
T cell proliferation inhibition; leukocyte antigen-DR2;
autoimmune disease; multiple sclerosis; Behcet's disease;
Crohn's disease; glomerulonephritis; Grave's disease;
Guillain-Barre syndrome; Hashimoto's thyroiditis;
idiopathic thrombocytopenic purpura; lichen planus; lupus erythematosus;
Meniere's disease; type I diabetes; psoriasis; Reiter's syndrome;
rheumatoid arthritis; scleroderma; Sjogren's syndrome;
Wegener's granulomatosis; myasthenia gravis; ulcerative colitis; uveitis;
stiff-man syndrome; vasculitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New amino acid derivatives, used as modulators of antigen presentation by human leukocyte antigen-DR class II major histocompatibility complex molecules, for treating autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to amino acid derivatives/compounds or their salts.
                                                                                                                                                                                                                                                                                                                                                                                      /note= "Acetylated residue"
                                                                                                                                                                                                                                                                                                                                         Location/Qualifiers

NADH2 dehydrogenase (BC 1.6.99.3) 39K chain - fava bean mitochondrion (fragment)
NyAlternate names: complex I 39K chain; NADH-ubiquinone reductase 39K chain
C;Species: mitochondrion Vicia faba (fava bean)
C;Date: 03-May-1994 #sequence_revision 07-Oct-1994 #text_change 09-Jul-2004
C;Accession: P60780
R;Leterne, S; Boutry, M
Plant Physiol. 102, 435-443, 1993
A;Title: Purification and preliminary characterization of mitochondrial complex I (NADH: A;Reference number: PQ0775; MUID:94151437; PMID:8108509
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A;Molecule type: protein

Strominger JL, Wucherpfennig KW; WPI; 1996-425218/42. Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antigens - useful in disease treatment, and method for identification of other self and non-self antigens implicated in auto-immune disease.

Claim 2; Page 45; 58pp; English.

Pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-myslin basic protein (MBP) solypeptide which is capable of tolerising an individual to an autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MHC class II protein, such as HLA-DR, which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with

```
The present invention describes a method for producing micelles with entrapped therapeutic agents. The method comprises: (1) combining negatively charged agent with a cationic lipid in a ratio where 30-90 % cof the negatively charged atoms are neutralised by positive charges on lipid molecules to form an electrostatic micelle complex in 20-80 % centanol; and (2) combining the micelle complex of (a) with fusogenic. Karyophilic peptide conjugates in a 0.0-0.3 ratio, therefore producing conference of the micelles with entrapped therapeutic agents. Also described is a method confluence of the micelle and a therapeutic agent in vivo, comprising the administration of the micelle. ABB7455 to ABB7468 represent specifically claimed nuclear localisation signal (NLS) peptides for use in the method as the customatic-karyophilic peptides. The micelles produced can have cytostatic and antitumour activities. The peptide-lipid-polynucleotide complexes produced are useful for inhibiting the progression of neoplastic conficence of invention relates to the field of gene therapy and is directed toward methods for producing peptide-lipid-polynucleotide complexes suitable for delivery of polynucleotides. The encapsulated complexes molecules display therapeutic efficacy in eradicating solid tumours
                                                                                                                                                                                                                                     ö
the autoimmune disease. This peptide is an internal peptide of Epstein-Barx virus DNA polymerase and is implicated as a foreign epitope involved in the aetiology or in remissions of multiple sclerosis. It has been shown capable of inducing the proliferation of autoreactive T-cell clones isolated from multiple sclerosis patients. (Updated on 16-OCT-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fusogenic; nuclear localisation signal; NLS; encapsulation; lipogene; liposome; micelle; karyophilic; cytostatic; antitumour; solid tumour; peptide-lipid-polynucleotide complex; neoplastic disease; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a vaccine composition for humans and animals against Japanese encephalitis viral infection. The composition comprises a chimeric synthetic peptide, especially an envelope glycoprotein of the Japanese encephalitis virus, to induce protective immunity against the viral infection, or a neutralising antibody inducing peptide sequences from the envelope glycoproteins of Japanese encephalitis virus. The vaccine composition is useful for inducing a protective immunity against Japanese encephalitis viral infection. This sequence represents a Japanese encephalitis virus vaccine peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine composition for inducing protective immunity against Japanese encephalitis viral infection, has synthetic peptide e.g. envelope glycoprotein of virus, or neutralizing antibody inducing glycoprotein sequences.
                                                                                                                                                                                                                                                                                                                                                                                     Virucide; Japanese encephalitis viral infection; protective immunity; chimeric synthetic peptide; viral infection; envelope glycoprotein; vaccine; neutralising antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a vaccine composition for humans and animals against Japanese encephalitis viral infection. The composition comprises a chimeric synthetic peptide, especially an envelope glycoprotein of the Japanese encephalitis virus, to induce protective immunity against the viral infection, or a neutralising antibody inducing peptide sequences from the envelope glycoproteins of Japanese encephalitis virus. The vaccine composition is useful for inducing a protective immunity against Japanese encephalitis viral infection. This sequence represents a Japanese encephalitis virus vaccine peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                Vaccine composition for inducing protective immunity against Japanese encephalitis viral infection, has synthetic peptide e.g. envelope glycoprotein of virus, or neutralizing antibody inducing glycoprotein
                                                                                                                             Virucide; Japanese encephalitis viral infection; protective immunity; chimeric synthetic peptide; viral infection; envelope glycoprotein; vaccine; neutralising antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Pharmaceutical preparations for tolerisation to antigens comprise either an isolated human non-collagen or non-wyalin basic protein (MBP) polypeptide which is capable of tolerising an individual to an autoantigen; or an isolated human pathogen polypeptide capable of tolerising an individual to that polypeptide. In both cases, the polypeptide (Whether self) includes an amino acid sequence corresponding to a sequence motif for a MGC class II protein, such as HLA br. which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive T-cells in individuals with the autoimmune disease. This peptide is an internal peptide of herpes simplex virus DNA polymerase and is implicated as a foreign epitope simplex eatiology or in remissions of multiple sclerosis. It has been shown capable of inducing the proliferation of autoreactive T-cell clones isolated from multiple sclerosis patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antigens - useful in disease treatment, and method for identification of other self and non-self antigens implicated in auto-immune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Intervening protein sequence, IVPS; protein splicing; protein production; maltose binding protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                         New modified target proteins - which have controllable intervening protein sequence which can facilitate production, purification, labelling or isolation of target proteins.
                                                                                                                                                                                                                                                                AAW80172-93 represent peptides eluted after biopanning against maltose binding protein, in the course of the invention. The specification describes IVPS (intervening protein sequence) regions which encode peptides which are removed via protein spilicing to form the native protein. The specification describes a modified protein comprising a target protein or portion, fused either internally or terminally, to a IVPS, or to an amino- or carboxyl-terminal element of a IVPS. The IVPS are capable of excision from or cleavage of the modified protein upon predetermined conditions, in cis or trans, e.g. temparature increase, deglycosylation, unblocking of amino acid residues, treatment with chemical reagents. The methods can be used for modifying, producing, purifying, labelling or isolating target proteins such as enzymes,

```
neutralising monoclonal antibody (588 antibody) that binds gp120 and also thibbits the binding of HIV to CD4. They were originally identified in the screening of phage epitope libraries having randomly generated epitope polypeptides accessible to the antibody. The libraries were ALPHA and ERSILON described in AAR83295 and AAR83299 respectively. The sequences of these polypeptides were deduced from their corresponding DNA sequence, determined by PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for making a diagnosis of an antigen. The method involves identifying the binding specificity of the anti-antigen antibody molecules in serum by the antibody detection by antigen mimics (ADAM) methodology. The method comprises screening phage libraries using sera from antigen-infected and non-infected individuals, and identifying peptides binding antibodies (ligands) specifically associated with the antigen. The method of the invention can be used for the detection of infectious agents, particularly Hepatitis C virus (HCV). The invention provides HCV-specific ligands which are useful for the preparation of a diagnostic assay for detecting HCV infection in a subject. The HCV-specific ligands are also useful for the preparation of waccines against HCV. ABG76670-ABG76741 represent HCV-specific ligands
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Making diagnosis of antigen, by identifying binding specificity of antiantigen antibody molecules in serum by antibody detection by antigen mimics methodology, and identifying antibodies associated with antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Binding specificity, anti-antigen antibody, serum, ADAM; antigen detection by antigen mimic, Hepatitis C virus infection, HCV,

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00110-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention
                                                                                                                                                                              Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif;

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TMP) super family and induces B cell tumour necrosis factor (TMP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDs activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression biological samples and may be used in this way to diagnose disease associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43290-ABP47228 represent the immunodeficiency syndrome (AIDS)). ABP43290-ABP47228 represent the immunodeficiency syndrome (AIDS). ABP43290-ABP47228 represent

ઠ 셤 This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13q34 and encodes a protein that is a member of the tumour

Example 1; SEQ ID NO 2469; 394pp; English.

```
cc necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFvs) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis infectious diseases such as AIDS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiathritic, neuroprocective, antialiergic and cytostatic. This captide sequence is a single chain antibody variable heavy CDR3 peptide that immunospecifically binds BLyS of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            An antigenic conjugate, useful as a vaccine for AIDS, has the formula (SPNS)n-(OMPC), where SPNE is a selected principal neutralisation epitope of HIV, which is one of 17 specified polypeptides (including the present sequence) or their fragments containing at least 5 amino acids and including the EWG region or its homologue in the sequence, OMPC is purified outer membrane proteosome of Naisseria (pref. N. meningitidis); and n is 1-200, indicating the number of SPNE moieties covalently linked to the OMPC. The conjugates may be substituted by anions, and conjugation may be via a bigeneric spacer. The SPNE polypeptides bind an HIV broadly
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antigenic conjugate useful as vaccine for AIDS - comprising HIV principal neutralisation epitope covalently linked to outer membrane proteosome of Neisseria.
